

The biological effects of magnetic frequencies

The electromotoric force "in phase" with the generated magnetic field. This is another advantage of the quantum impulse form in comparison to other therapeutic devices on the market. The top curve has an effect on the body, which was induced by the bottom curve. The two positively stimulating impulses which last about 2 milliseconds, have the function of ion collector. The contra-impulse which starts suddenly, extracts H-ions (see below), induces the "H-Hopping" and pushes them onto the vessel membrane where they practise their therapeutic effects.

**Der „Trick“ der Quantronik
Der Ionentransport sorgt für Stoffwechsel**
